IoT for Utilities: A demonstration of the Energy Queensland Demand Response Solution

Eric Hamilton
NNNCo

Following a successful Proof of Concept in 2016, NNNCo designed and delivered a trial Low Power Wide Area Network (LPWAN) demand response load control IoT solution for Energy Queensland.

The solution provides the utility with granular control to switch individual loads on and off to maximise efficiency and minimise grid risk.

This session will provide an overview of the solution, results and learnings, and a practical demonstration.
